

Zararlı Powershell Analizi

written by Mert SARICA | 1 January 2019

Sysmon gibi ücretsiz, FireEye HX, Carbon Black Response gibi ticari EDR (endpoint detection & response) güvenlik teknolojilerine sahip olan kurumların yakından izlediği alarmların başında, hemen hemen her tehdit raporunda, araştırma yazısında adının sıklıkla geçtiği Powershell olduğunu az çok tahmin edebilirsiniz. Invoke-Obfuscation gibi yardımcı araçlar nedeniyle hedef işletim sisteminde Powershell kullanımının tespit edilmesinin çok daha zorlaştığı günümüzde, EDR teknolojilerine olan bağımlılık ve Powershell kayıtlarına olan ihtiyaç, kurumlar için elzem bir hale gelmiştir.

Her güvenlik teknolojisinde olduğu gibi EDR teknolojisinde de alarmları analiz edebilecek yetkinlikte insan kaynağı olmadan bu teknolojiye sahip olmak, kurumlar için ölü bir yatırım olmaktan öteye gidememektedir.

Analistler sayesinde komut satırında tespit edilen bir alarmın günün sonunda hedef sistemin belleğinde çalıştırdığı kabuk kodunun (shellcode) türüne, bağlantı noktasına kadar önemli bilgilere erişmek mümkün olabilmektedir.

Örneğin kurumunuzdaki EDR sisteminiz şüpheli bir Powershell kullanımı ile ilgili olarak aşağıdaki şekilde bir alarm ürettiğinde Siber Güvenlik Merkezi'nizdeki analistlerin en kısa sürede bu alarmı analiz etmek için işe koyulmaları gerekmektedir.

Alarmeda dikkat çeken kısımların başında GzipStream, FromBase64String, IO.MemoryStream geldiğini görebilir ve buradan yola çıkarak GZIP ile paketlenip, Base64 ile gizlenmiş bu verinin bellekte bir işlem gerçekleştirdiği varsayımında bulunabilirsiniz.

Kali üzerinde bulunan echo, base64, xxd, gunzip komut satırı araçlarından faydalanarak kısa sürede gizlenmiş bu veriyi aşağıdaki şekilde çözebilirsiniz.

```

```

Ortaya çıkan Powershell betiğinin bellekten .Net API yardımı ile Windows API fonksiyonları çağırarak özetle bellekte yer açıp, açılmış belleğe, FromBase64String() fonksiyonu içinde yer alan kod parçasını kopyaladıktan sonra yeni bir iş parçacığı (thread) oluşturup, bu kod parçasını çalıştırdığını görebilirsiniz.

FromBase64String() fonksiyonu içinde yer alan kod parçasını çözmek için ise yine echo, base64, xxd komutlarından faydalanabilirsiniz. Ancak bu defa elinizde bellekten çalışmak üzere hazırlanmış bir kabuk kodu olduğu için ilave olarak shellcode2exe ve Radare2 araçlarından da faydalanmanız gerekmektedir.

```

root@ubuntu:~# file payload2.bin
payload2.bin: data
root@ubuntu:~#
root@ubuntu:~# python shellcode2exe.py
shellcode to executable converter
by Mario Vilas (mvilas at gmail dot com)

Usage:
    shellcode2exe.py payload.bin [payload.exe]
    [--arch=i386|powerpc|sparc|arm]
    [--os=windows|linux|freebsd|openbsd|solaris]
    [-c Allow for ascii shellcode as a cmd line parameter]
    [-s Allows for ascii shellcode in file]
    [-d Allows for unicode shellcode as a cmd line parameter]
    [-u Allows for unicode shellcode in file]

Options:
    -h, --help                show this help message and exit
    -a ARCH, --arch=ARCH      target architecture [default: i386]
    -o OS, --os=OS            target operating system [default: windows]
    -c, --asciicmd            enable ascii entry in command line (e.g. -c
                              '\x90\x90')
    -s, --asciifile           enable ascii entry in input file
    -d, --unicodcmd           enable unicode entry in command line (e.g. -d
                              '%u9090')
    -u, --unicodfile          enable unicode entry in input file
root@ubuntu:~#
root@ubuntu:~# python shellcode2exe.py -o linux payload2.bin shellcode
shellcode to executable converter
by Mario Vilas (mvilas at gmail dot com)

Reading raw shellcode from file payload2.bin
Generating executable file
Writing file shellcode
Done.
root@ubuntu:~#
root@ubuntu:~# file shellcode
shellcode: ELF 32-bit LSB executable, Intel 80386, version 1 (SYSV), statically linked, corrupted section header size
root@ubuntu:~#
root@ubuntu:~#

```

Radare2 ile shellcode dosyasını analiz ettiğinizde ise aslında bunun Metasploit'in 4444. bağlantı noktasında dinleyen bir bind kabuk kodu olduğunu görebilirsiniz.

```

root@ubuntu:~# r2 shellcode
warning: read (strtab) at 0x20
warning: Cannot initialize strings table
[0x08048054]> pd

```

```

Sonuca gelecek olursak, bu örnekten yola çıkarak günümüzde gerçekleştirilen ileri seviye siber saldırılarla mücadelede EDR gibi teknolojilerden kurumların tam anlamıyla faydalanabilmeleri için alarmları analiz edebilecek yetkin insan kaynağına da bir o kadar ihtiyaçları bulunmaktadır.

Bir sonraki yazıda görüşmek dileğiyle herkese güvenli günler dilerim.

Not:

1. Bu yazı ayrıca Pi Hediyem Var #14 oyununun çözüm yolunu da içermektedir.
